

PV Real-World Data, Challenges and Approaches to Generate Synthetic Data

Availability of Real-World PV data

- Major obstacle: **Privacy concern** on PV generation data
- Other sources of data which can play the **alternative** role to have access to the PV generation data:
 - Meteorological datasets,
 - ✓ Available for different site locations, at different times of the year, and with a variety of time resolutions.
 - Concern: It needs to be processed before it can be used in power system studies.
- Learning about the methods which convert the meteorological data to PV generation data is necessary.

Different Approaches to Generate PV Output Synthetically

- **Physical Methods (without using historical PV output data):**
 - Based on the PV power plant characteristics, such as location, different meteorological data
 - Are considerably simple (they are only based on the global solar irradiance)
 - The accuracy is higher when the weather conditions are stable
 - These models are highly sensitive to weather forecasting and they should be designed specifically for a particular PV plant and location.
- **Methods using historical PV output data**
 - Synthetically generates PV output for either **another period of time** OR for **nearby PV plants**.

Physical Methods

- Popular software and website for synthetically generate PV output:
 - PVGIS [1]
 - PVSYST [2]
 - SAM [3]
 - RETSCREEN [4]
 - PV*SOL [5]
- Other useful software :
 - HOMER [6], etap [7], etc.
- Online free photovoltaic software :
 - Global Solar Atlas [8], DIAFEM [9], SISIFO [10], EASY-PV [11], and PVWATTS free solar calculator [12], etc.
 - ✓ Provides hourly or monthly PV generation.

- PVGIS is a web site that gives you information about solar radiation and PV system performance.

- Outputs:
 - Daily PV output in each month.
 - It also shows the yearly average production per day and gives statistics data.

- PVSYST software is a European-based PV system predictor developed by the University of Geneva for the European Energy Center.
- Input:
 - meteorological and global irradiation data from Meteonorm and NASA-SSE. (other external databases can be introduced)
 - It has got an extensive database of available PV panels, inverters, and batteries which is directly updated by the manufacturers
- Outputs:
 - PV production
 - Monthly diagram of standard production per installed is generated, including the following information: power loss, total energy produced, the effective power to the output of the generator, the energy injected into the network, the electrical efficiency of the facility, and a table with the solar irradiation data (horizontal global irradiation, incident irradiation at the receptor).

- System Advisor Model (SAM) is provided by the National Renewable Energy Laboratory (NREL) of the U.S. Department of Energy.
- Inputs:
 - hourly weather data
 - data that the user may introduce.(SAM includes a wide database of PV panels and inverters, and it is possible to define new elements)
- Outputs:
 - hourly PV simulation model with performance, cost, and finance models to calculate energy output, energy costs, and cash flows.

RETScreen[®]
Expert

- RETSCREEN is managed by the research center of Natural Resources Canada (NRCan).
- Inputs:
 - Type of panel (poly-Si, mono-Si, etc.),
 - Total PV installed power of facility,
 - Efficiency, estimated electrical losses, losses caused by shadows.
 - Inverter data, defined by the user, are input power, performance and estimated losses.
- Outputs:
 - Daily solar horizontal irradiation by month,
 - The estimation of annual electricity production (MWh),
 - Environmental benefits (CO₂ emissions savings, equivalent in barrels of petroleum), return on investment period, evolution of the benefits over the operating life of the installation, internal rate of return (IRR), net present value (NPV), and unit cost of energy.

- PV*SOL is software for planning, design, and simulation of PV systems developed by Valentin Software.
- Inputs:
 - Meteorological data which is based on Meteonorm database. It is also possible for users to load their own climate data to the project.
 - Panels and inverters and wiring information
- Outputs:
 - The predicted monthly electrical production of the system, its performance ratio, the irradiance received on the module's plane and its temperature, a general energy balance of the system, and a financial analysis of the installation.

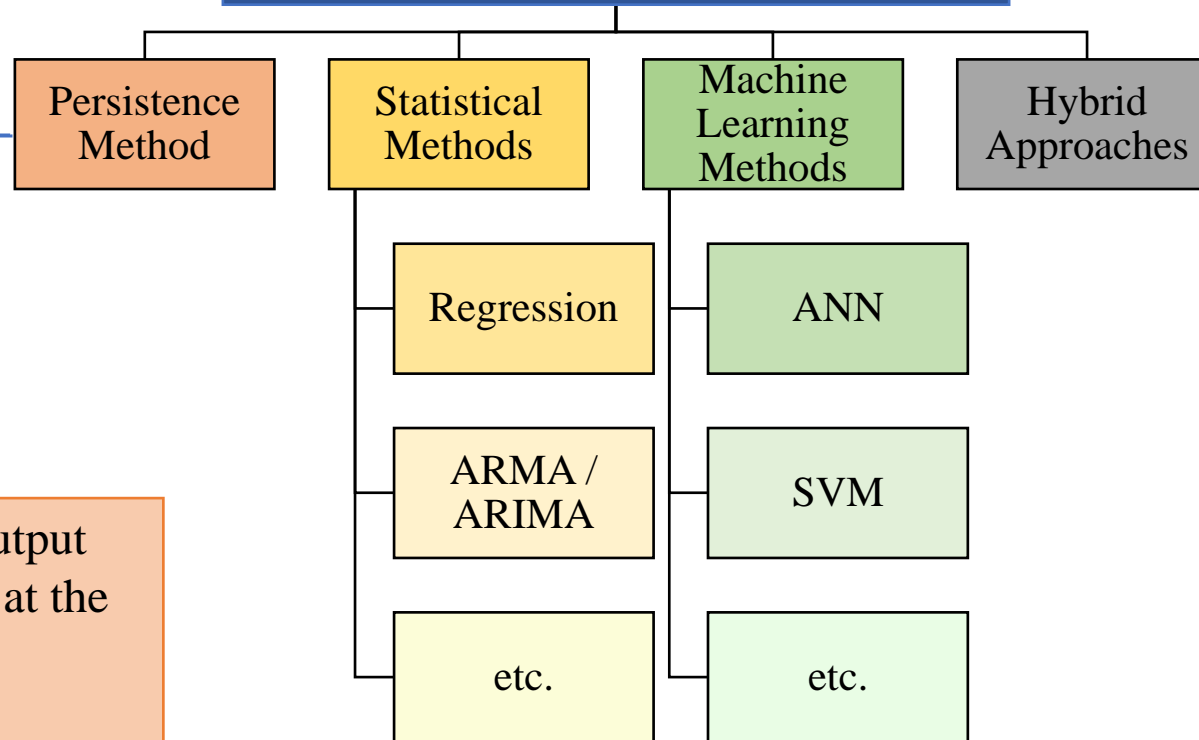

Methods Using Historical PV Output Data

- Having access to PV data for a few sites in a region, but we seek for PV production in nearby sites.
- Availability of PV data for a short time interval, but we require data for longer span of time.
- ✓ We need to synthetically generate data using historical data and other available meteorological data.

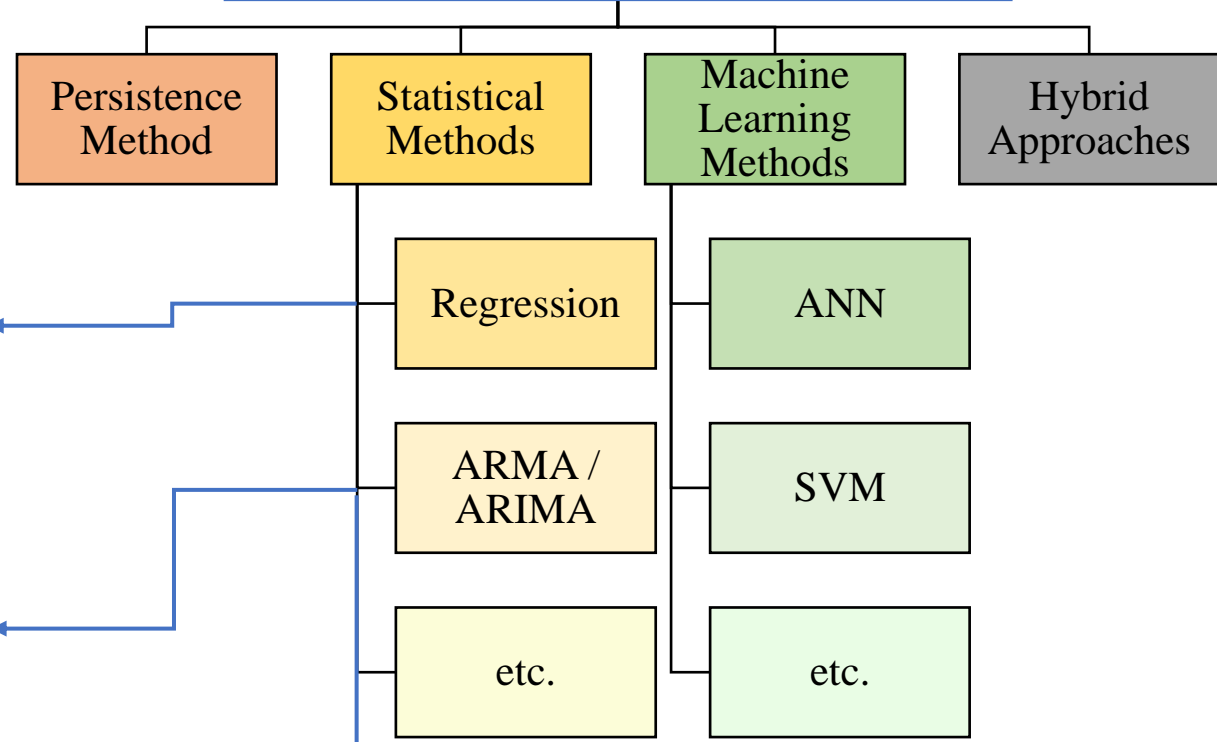

PV Output Forecasting Using Historical Data

For DAH: Synthetic PV output equals to the previous day at the similar time.

- Suitable for short time forecasting

PV Output Forecasting Using Historical Data

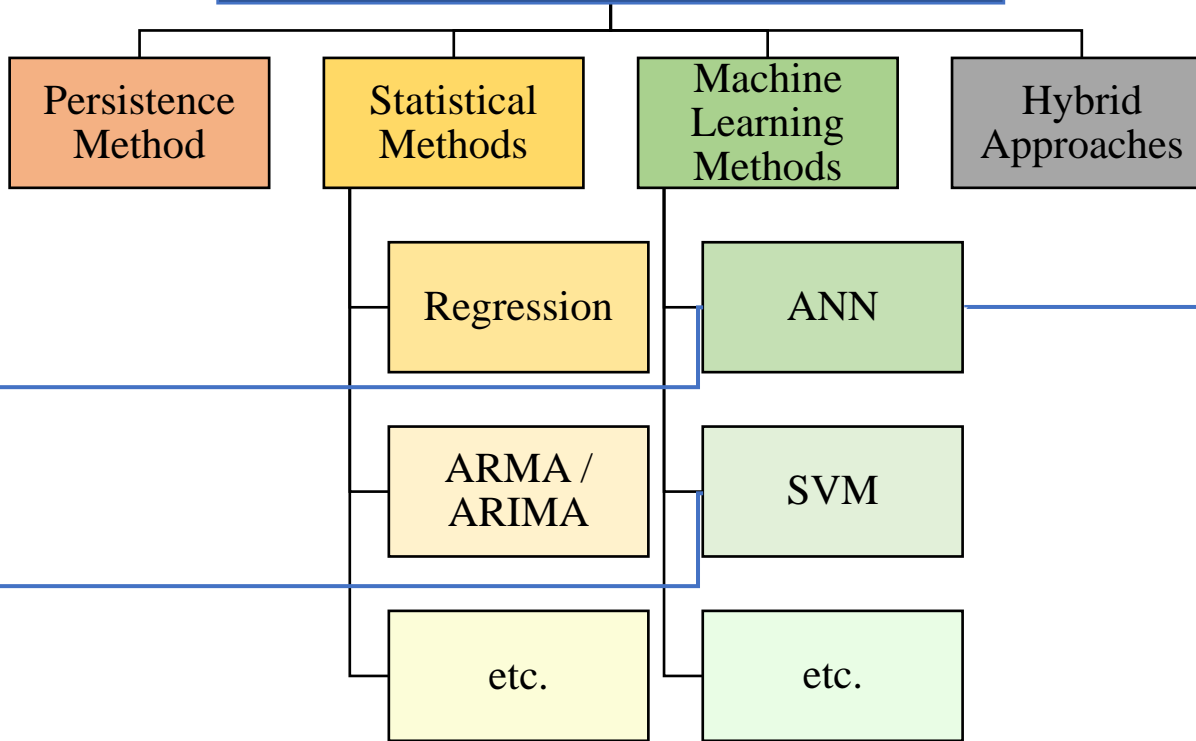

- It establishes a relation between the explanatory variable and dependent variables.
PV output: dependent var.
Meteorological & historical data: explanatory var.
- Weakness:** A mathematical model and several explanatory variables are required to design a good regression-based estimation model.

- Auto Regressive Moving Average**
- Popular, because of its capability to extract the statistical properties.
- ARIMA, i.e., an extension of ARMA, an integrated part removes any non-stationarity from the data.

$$X(t) = \sum_{i=1}^p \alpha_i X(t-i) + \sum_{j=1}^q \beta_j e(t-j)$$

↓ PV output
 ↓ Regression part
 ↓ White noise

PV Output Forecasting Using Historical Data

Weakness: large data is needed to have good ML method results.

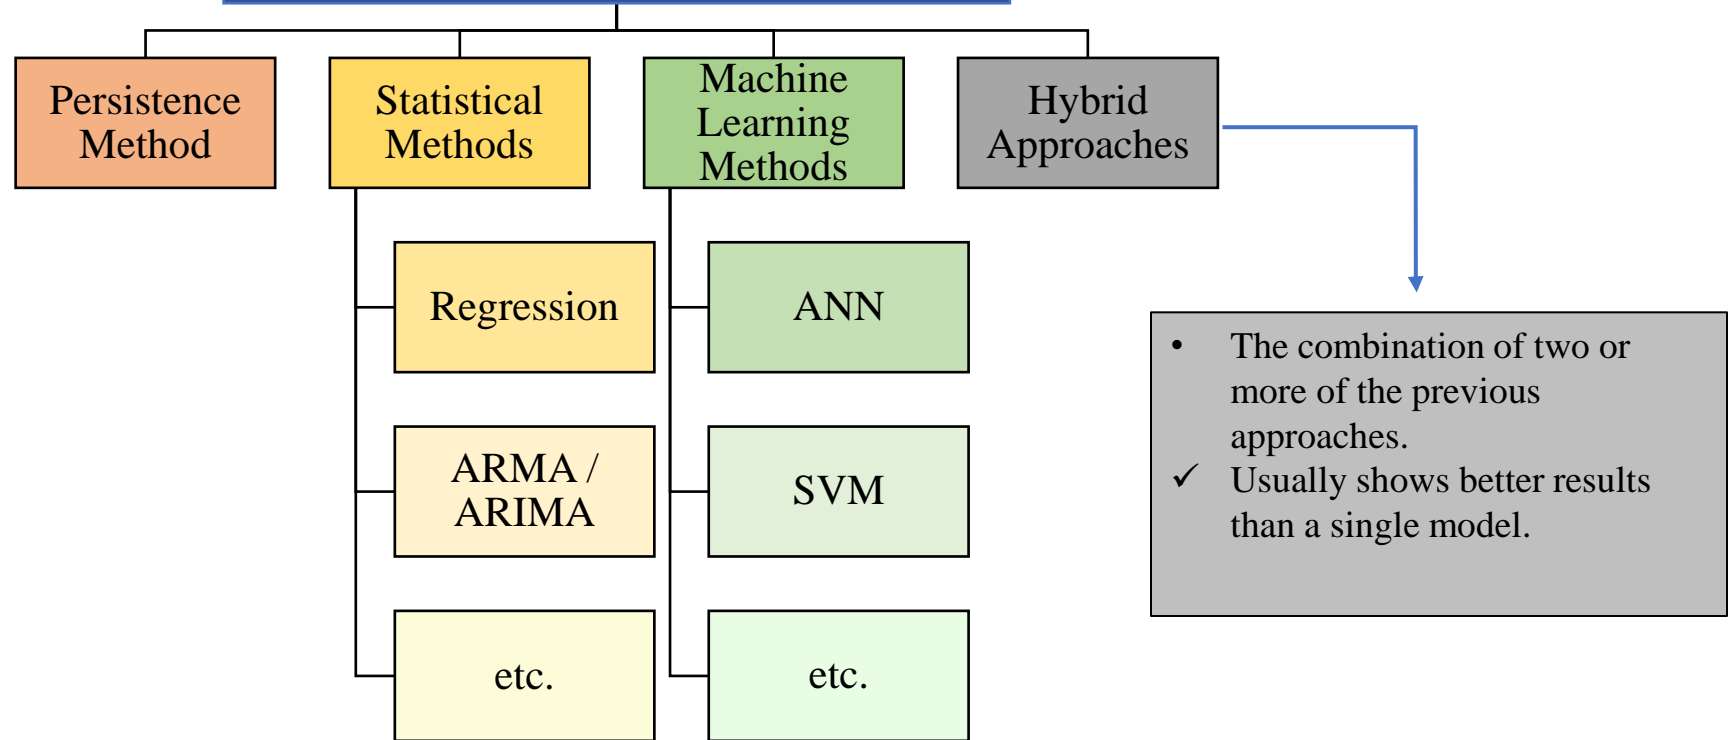

✓ An intelligent technique which can handle linear and nonlinear data patterns.

- Artificial Neural Network is highly used in forecasting PV power generation because of the nonlinearity in meteorological data.

- Support Vector Machine is a supervised ML method.
- **Weakness:** The performance of the SVM-based model highly depends on the selection of three parameters, (i.e., penalty (C), tube radius (ϵ), and the kernel function's parameter.)
